# Chapter 1

### 1.1 Sine

$$f(x) = \sin(x)$$
$$-1 \le \sin(x) \le 1$$
$$\sin(0) = 0$$

For all integer multiples  $\pi$ , sin() attains 0

$$\sin(k\pi) = 0$$
, Where k is an integer

The graph of sine is periodic with a period of  $2\pi$ , meaning it repeats itself every interval of  $2\pi$ 

#### 1.1.1 Derivative of sin(x)

```
Definition 1.1.1: \sin(x)
if y = \sin(x)
y' = \cos(x)
```

**Proof:** 

$$y' = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h}$$

$$\frac{\sin(x+h) - \sin(x)}{h}$$

$$\therefore \frac{\sin(x+h) - \sin(x)}{h}$$

$$\frac{\sin(x) \cos(h) + \cos(x) \sin(h) - \sin(x)}{h}$$

$$\frac{\sin(\cos(h) - 1) + \cos(x) \sin(h)}{h}$$

$$y' = \lim_{h \to 0} \frac{\sin(\cos(h) - 1)}{h} + \frac{\cos(x) \sin(h)}{h}$$

$$y' = \lim_{h \to 0} \frac{\sin(\cos(h) - 1)}{h} + \lim_{h \to 0} \frac{\cos(x) \sin(h)}{h}$$

$$\therefore \lim_{x \to a} f(x) + \lim_{x \to a} g(x) = \lim_{x \to a} (f(x) + g(x))$$

$$= \sin(x) \lim_{h \to 0} \frac{\cos(h) - 1}{h} + \cos(x) \lim_{h \to 0} \frac{\sin(h)}{h}$$

$$\therefore \lim_{h \to 0^{+}} \frac{\cos(h) - 1}{h} = 0$$

$$\lim_{h \to 0^{+}} \frac{\cos(h) - 1}{h} = 0$$

$$\lim_{h \to 0^{+}} \frac{\cos(h) - 1}{h} = 0$$

$$= \sin(x) \times 0 + \cos(x) \lim_{h \to 0} \frac{\sin(h)}{h}$$

$$= \cos(x) \lim_{h \to 0} \frac{\sin(h)}{h}$$

$$\lim_{h \to 0^{+}} \frac{\sin(h)}{h} = 1$$

$$\lim_{h \to 0^{+}} \frac{\sin(h)}{h} = \cos(x) \times 1$$

$$\therefore \lim_{h \to 0} \frac{\sin(h)}{h} = \cos(x) \times 1$$

$$=\cos(x)$$

⊜

### 1.2 Cosine

$$f(x) = \cos(x)$$
$$-1 \le \cos(x) \le 1$$
$$\cos(0) = 1$$

# 1.3 Tangent

$$f(x) = \tan(x)$$
$$-1 \le \tan(x) \le 1$$
$$\tan(0) = 0$$

#### 1.3.1 Vertical Asymptote

Note:-

A vertical line (x,0) where the values of a function rise or fall infinitely

The line x = a is a vertical asymptote of f(x) if

$$\lim_{x \to a} f(x) = \pm \infty$$

The zero points of cos(x) create a vertical asymptote in relation to tan(x)

#### 1.3.2 Derivative of tan(x)

**Definition 1.3.1:** tan(x)

if 
$$y = \tan(x)$$

$$y' = \sec^2(x)$$

**Proof:** 

$$y = \tan(x) = \frac{\sin(x)}{\cos(x)}$$

$$y' = \frac{\cos(x)(\cos(x)) - \sin(x)(-\sin(x))}{(\cos(x))^2}$$

$$y' = \frac{v \times u' - u \times v'}{v^2}$$

$$y' = \frac{\cos^2(x) + \sin^2(x)}{\cos^2(x)}$$

$$y' = \frac{\cos^2(x)}{\cos^2(x)} + \frac{\sin^2(x)}{\cos^2(x)}$$

$$y' = 1 + (\frac{\sin(x)}{\cos(x)})^2$$

$$y' = 1 + \tan^2(x)$$

$$= \sec^2(x)$$

⊜

### 1.4 Secant

$$f(x) = \sec(x)$$
$$1 \le \sec(x) \le 1$$
$$\sec(0) = 1$$

# 1.4.1 Derivative of sec(x)

**Definition 1.4.1:** sec(x)

if 
$$y = \sec(x)$$
  
$$y' = \sec(x)\tan(x)$$

# Chapter 2

# 2.1 Inverse Trigonometric Functions

In the case where

$$f[g(x)] = x$$

and

$$g[f(x)] = x$$

When can say the function f is the inverse of function g, due to the function g being able to extract the original input of the function f.

Therefore the derivative of the inverse function  $y = \sin^{-1}(x)$  is as follows:

$$\sin(y) = x$$

$$\frac{d}{dx}\sin(y) = \frac{d}{dx}x$$

$$\cos(y)\frac{dy}{dx} = 1$$

$$\frac{dy}{dx} = \frac{1}{\cos(y)}$$

Using the identity 
$$\cos^2(y) + \sin^2(y) = 1$$
  

$$\cos(x) = \sqrt{1 - \sin^2(x)}$$

$$\frac{dy}{dx} = \frac{1}{\sqrt{1 - \sin^2(y)}}$$
And since  $x = \sin(y)$   

$$\sin^2(y) = x^2$$

$$\frac{dy}{dx} = \frac{1}{\sqrt{1 - x^2}}$$

#### **Example 2.1.1** (Find the derivative of $\cos^{-1}(x)$ )

$$y = \cos^{-1}(x)$$

$$\cos(y) = x$$

$$-\sin(y)\frac{dy}{dx} = 1$$

$$\frac{dy}{dx} = -\frac{1}{\sin(y)}$$
Using the identity  $\cos^2(y) + \sin^2(y) = 1$ 

$$\sin(y) = \sqrt{1 - \cos^2(y)}$$

$$\frac{dy}{dx} = -\frac{1}{\sqrt{1 - \cos^2(y)}}$$
And since  $x = \cos(y)$ 

$$\cos^2(y) = x^2$$

$$= \frac{dy}{dx} = -\frac{1}{\sqrt{1 - x^2}}$$

#### **Example 2.1.2** (Find the derivative of $tan^{-1}(x)$ )

$$\tan(y) = x$$

$$\sec^{2}(y)\frac{dy}{dx} = 1$$

$$\frac{dy}{dx} = \frac{1}{\sec^{2}(y)}$$
From the identity  $1 + \tan^{2}(y) = \sec^{2}(y)$ 

$$\frac{dy}{dx} = \frac{1}{1 + \tan^{2}(y)}$$
And since  $x = \tan(y)$ 

$$\tan^{2}(y) = x^{2}$$

$$= \frac{dy}{dx} = \frac{1}{1 + x^{2}}$$

#### 2.1.1 Questions

#### Question 1

$$y = \sin^{-1}(5x + 9)$$

Solution:

$$\sin(y) = 5x + 9$$

$$\cos(y)\frac{dy}{dx} = 5$$

$$\frac{dy}{dx} = \frac{5}{\cos(y)}$$
Using the identity 
$$\cos^2(y) + \sin^2(y) = 1$$

$$\cos(y) = \sqrt{1 - \sin^2(y)}$$

$$\frac{dy}{dx} = \frac{5}{\sqrt{1 - \sin^2(y)}}$$
And since  $x = \sin(y)$ 

$$\frac{dy}{dx} = \frac{5}{\sqrt{1 - (5x + 9)^2}}$$

#### Question 2

$$y = \sin^{-1}(x)$$

Solution:

$$\sin(y) = x$$

$$\cos(y) \frac{dy}{dx} = 1$$

$$\frac{dy}{dx} = \frac{1}{\cos(y)}$$
Using the identity 
$$\cos^2(y) + \sin^2(y) = 1$$

$$\cos(y) = \sqrt{1 - \sin^2(y)}$$

$$\frac{dy}{dx} = \frac{1}{\sqrt{1 - \sin^2(y)}}$$
And since  $x = \sin(y)$ 

$$\frac{dy}{dx} = \frac{1}{\sqrt{1 - x^2}}$$

$$y = \cos^{-1}(x)$$

#### Solution:

$$\cos(y) = x$$

$$-\sin(y)\frac{dy}{dx} = 1$$

$$\frac{dy}{dx} = -\frac{1}{\sin(y)}$$
Using the identity  $\cos^2(y) + \sin^2(y) = 1$ 

$$\sin(y) = \sqrt{1 - \cos^2(y)}$$

$$\frac{dy}{dx} = -\frac{1}{\sqrt{1 - \cos^2(y)}}$$
And since  $x = \cos(y)$ 

$$\frac{dy}{dx} = -\frac{1}{\sqrt{1 - x^2}}$$

# Chapter 3

# 3.1 Relationships

$$\cos(x - \frac{\pi}{2}) = \sin(x)$$
$$\sin(x + \frac{\pi}{2}) = \cos(x)$$

# 3.2 Identities

#### 3.2.1 Reciprocal Identities

$$\sin(\theta) = \frac{1}{\csc(\theta)}$$
 or  $\csc(\theta) = \frac{1}{\sin(\theta)}$ 

$$\cos(\theta) = \frac{1}{\sec(\theta)} \text{ or } \sec(\theta) = \frac{1}{\cos(\theta)}$$

$$\tan(\theta) = \frac{1}{\cot(\theta)} \text{ or } \cot(\theta) = \frac{1}{\tan(\theta)}$$

## 3.2.2 Pythagorean Identities

$$\sin^{2}(\theta) + \cos^{2}(\theta) = 1$$
$$1 + \tan^{2}(\theta) = \sec^{2}(\theta)$$
$$\csc^{2}(\theta) = 1 + \cot^{2}(\theta)$$

#### 3.2.3 Ratio Identities

$$\tan(\theta) = \frac{\sin(\theta)}{\cos(\theta)}$$
$$\cot(\theta) = \frac{\cos(\theta)}{\sin(\theta)}$$

#### 3.2.4 Sum and Difference of Angles

$$\begin{split} \sin(\alpha+\beta) &= \sin(\alpha) \times \cos(\beta) + \cos(\alpha) \times \cos(\beta) \\ \sin(\alpha-\beta) &= \sin(\alpha) \times \cos(\beta) - \cos(\alpha) \times \sin(\beta) \\ \cos(\alpha+\beta) &= \cos(\alpha) \times \cos(\beta) - \sin(\alpha) \times \sin(\beta) \\ \cos(\alpha-\beta) &= \cos(\alpha) \times \cos(\beta) + \sin(\alpha) \times \sin(\beta) \\ \tan(\alpha+\beta) &= \frac{\tan(\alpha) + \tan(\beta)}{1 - \tan(\alpha) \times \tan(\beta)} \\ \tan(\alpha-\beta) &= \frac{\tan(\alpha) - \tan(\beta)}{1 + \tan(\alpha) \times \tan(\beta)} \end{split}$$

# 3.2.5 Double Angles

$$\sin(2\theta) = 2\sin(\theta)\cos(\theta)$$
$$\cos(2\theta) = \cos^2(\theta) - \sin^2(\theta)$$
$$= 2\cos^2(\theta) - 1$$
$$= 1 - 2\sin^2(\theta)$$
$$\tan(2\theta) = (2\tan(\theta))/(1 - \tan^2(\theta))$$
